Please replace the abstract as follows:

ABSTRACT

A18
A schema-based inbox service that provides Internet access to per-user inbox data, (e.g., name, address, telephone numbers and e-mail addresses), wherein access to the inbox data is based on each user's identity. The inbox service includes a schema that defines rules and a structure for each user's data, and also includes methods that provide access to the data in a defined way. The inbox schema thus corresponds to a logical document containing the data for each user. The user may then manipulate (e.g., read or write) data in the logical document or retrieve data from the logical document by data access requests through defined methods.
